

Tenecom Email Sweep (TES) MessageLabs Email Anti-Spam v4

TES and MessageLabs Anti-Spam v4 - Summary

TES & MessageLabs Email Anti-Spam, dramatically reduces the amount of unsolicited messages reaching your organization. It eliminates the loss of employee productivity associated with reading and deleting spam and substantially reduces the technical costs associated with these unsolicited emails.

Messaging Security

For any organization, managing and securing electronic communications is vital. New threats can significantly impact business continuity and employee productivity. Threats from the Internet are converging, not only within email but across the web and instant messaging. Malware authors combine the 'one-two punch' of viruses followed by spam to break down an organization's defenses. They adopt increasingly sophisticated techniques to capitalize on organizations' weaknesses, while using spam to propagate fraudulent content and steal personal information. Attacks masquerade as genuine email addresses and web links, direct users to unsecured sites where viruses and other malware are unleashed. Entire corporate networks can be compromised by opening just one email or a single web page.

Maintaining continuity of service is crucial for all businesses. Organizations that cannot stop threats from entering the network are critically vulnerable to network downtime and loss of data or business information.

Tenecom's Managed Service for Anti-Spam

To effectively combat rising messaging threats and comply with the increasing demands of corporate regulations, companies are seeking the most comprehensive email anti-spam solution. Tenecom's managed service for SPAM, offers a predictable cost structure and creates a limited need for internal resources for ongoing management and support.

Tenecom's managed anti-spam service, works by filtering email before it reaches the corporate network and requires no hardware or software on at the client premises.

Multi-layered Security

The more layers of defense one has, the stronger and more comprehensive the protection is. MessageLabs offers a multi-layered solution designed to combat both known and unknown spam to deliver a fast, reliable and superior service with guaranteed spam capture rates of at least 95% and false positives of 1 in 250,000.

MessageLabs continues to deploy innovative techniques at the perimeter of its infrastructure as part of the ongoing battle against unwanted email from spammers, virus writers and other malware authors. To identify unknown and new spam, MessageLabs uses its patented Skeptic technology that incorporates thousands of heuristics rules, Bayesian learning, smart signatures, fuzzy fingerprinting and dynamic header analysis. Skeptic learns from each message it sees and provides near-perfect accuracy to virtually eliminate false positives.
